Starting hematite (Fe₂O₃), zinc oxide (ZnO) and manganese carbonate (MnCO₃) powders were homogenized in a planetary ball mill in stainless steel bowls with stainless steel balls for 15 min, calcined in air at 1000 °C for 2 h, milled in a planetary ball mill for 30 minutes, followed by 4 h in an agate mill, sieved through a 325 mesh to form four starting powders: MnFe₂O₄, ZnFe₂O₄, Mn_{0.5}Zn_{0.5}Fe₂O₄ and a two-phase mixture of zinc and manganese ferrite. Structural properties of the obtained powders were analyzed using XRD, SEM and EDS. Electrical properties of disk shaped samples were measured at room temperature on an impedance analyzer in the frequency range 100 to 40 MHz, enabling determination and comparison of dielectric permittivity and complex impedance. Complex relative permeability of toroid shaped samples was measured on an impedance analyzer in the frequency range from 1 MHz to 500 MHz.
