

**Serbian Ceramic Society Conference
ADVANCED CERAMICS AND APPLICATION**

Organized by
Serbian Ceramic Society
&
Institute of Technical Sciences of SASA

PROGRAM AND THE BOOK OF ABSTRACTS

**Serbian Academy of Sciences and Arts, Knez Mihailova 35
May 10-11th, 2012, Belgrade, Serbia**

Book title: Serbian Ceramic Society Conference - ADVANCED CERAMICS AND APPLICATION: Program and the Book of Abstracts

Publisher:

Serbian Ceramic Society

Editors:

Prof. Dr. Vojislav Mitić

Dr. Nina Obradović

Dr. Lidija Mančić

Technical Editor:

Aleksandra Stojičić

Printing:

Serbian Academy of Sciences and Arts,
Knez Mihailova 35, Belgrade, Serbia

Format

Pop Lukina 15, Belgrade, Serbia

Edition:

70 copies

Multiferroic materials simultaneously possess two or more ferroic orders, and enable a coupling interaction between them. Multiferroic bismuth manganite is known as a material that exhibits both ferromagnetic and ferroelectric properties making it interesting for various technological applications. Unfortunately, preparation of BiMnO₃ is not possible by conventional solid state reaction and BiMnO₃ has been synthesized from the mixture of oxides only at high pressures (> 40 kbar). The aim of this work was to synthesize BiMnO₃ (BMO) without additional heating or application of high pressures. Nanocrystalline single-phased BMnO₃ was prepared for the first time by mechanochemical synthesis directly from the highly activated constituent oxides, Bi₂O₃ and Mn₂O₃, in a planetary ball mill. The obtained materials were characterized by X-ray diffraction, SEM with EDS analysis, HRTEM and magnetization measurements. All the samples were found to be tetragonal perovskite with P4mm crystallographic group. The broad maxima reflections of BMO samples can be ascribed to an amorphous/disordered phase. HRTEM micrographs give clear evidence of core-shell structure with amorphous shell around the nanocrystalline BMO particles. The magnetic hysteresis behavior is similar to that of a soft ferromagnet. The magnetic properties of the obtained BMO powders were found to change as a function of milling time in a manner consistent with the variation in the nanocomposite microstructure.
