The BaTiO₃ ceramics applications based on electronic properties have very high gradient scientific and industrial-technological interests. Our scientific research has been based on nano BaTiO₃ with MOD-Y salts and also on Y₂O₃. The samples have been consolidated at sintering interval 1200 – 1350 °C. We demonstrate the new frontiers for different electronic properties between the layers of BaTiO₃ grains. As a research target we had GB composite, Nano size metal oxide dispersions, AC-DC safety capacitance, nano scale grain boundary control, capacitance, GB control mobility in DC BS operation voltage. We applied all related characterizations and especially SEM. Fractal nature characterization and corrections include influences grains and pores surface and Brownian motions of particles. We established relation with all of this characteristics and temperature. Throw this experiments and results and fractals characterization, we opened new perspectives for higher electronic properties integrations between the grains and practically established the control within the processing, morphological structures and designing the properties. This is very important, new approach towards further miniaturization-fractal miniaturization and related, advanced technologies.
